## **MATERIALS PAINT**

---

There are many types and manufacturers of paint that are specifically formulated for plastic substrates. As such, at PEI we have selected Sherwin-Williams as our standard paint supplier because of their extensive product line, excellent service, short leadtimes, and depth of knowledge with all types of painting applications. If, however, you have a specific paint by another manufacturer that has been specifically formulated for your company, we will be happy to source the material with the vendor of your choice.

For those enclosures on which we use the Sherwin-Williams paint, the specific product we typically use would be one of their Polane™ types of materials. This specific family of paint is a 2 part urethane that has excellent adhesion qualities for ABS, polystyrene, PVC, and acrylic plastics. Furthermore, once the paint is fully cured the surface of the product will be tougher than the original plastic substrate.

For more information on this material, please visit the [Sherwin-Williams](#) website or download the MSDS document by clicking on the PDF button located on this web page.
